**Empathy Map Canvas – Import Data Using Transform Maps**

**THINK & FEEL:**

The user wants employee data to be imported into ServiceNow accurately and efficiently. They want to ensure that the data remains correct and consistent during repeated imports.

**HEAR:**

The user needs to import employee data from an Excel spreadsheet, map the source fields to the correct target fields, and verify the success of the transformation.

**SEE:**

The user sees employee information in a spreadsheet, an Import Set table for staging the data, a Transform Map for mapping fields, and employee records created or updated in ServiceNow.

**SAY & DO:**

The user prepares the Excel data, loads it into ServiceNow, creates a Transform Map, maps the employee fields, runs the transformation, and checks the Transform History to verify inserted and updated records.

**PAIN:**

The user faces problems such as manual data entry, duplicate employee records during repeated imports, incorrect field mapping, and difficulty in checking imported data.

**GAIN:**

The user gets faster employee-data import, accurate field mapping, duplicate prevention using Coalesce, easier data validation, and better visibility through reports and dashboards.

**Example:**

## Empathy Map
