

IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

Date	Oct 2 nd 2026
Team ID	6ab8c330c23107aaaa72e953
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	

SCENARIO Importing, validating, transforming, and updating employee information in ServiceNow using a spreadsheet, Import Sets, and Transform Maps.

JOURNEY Prepare spreadsheet → Open ServiceNow → Upload data → Validate → Map fields → Transform → Insert or update → Verify

JOURNEY MAP	STAGE 1	STAGE 2	STAGE 3	STAGE 4	STAGE 5	STAGE 6	STAGE 7	STAGE 8	STAGE 9
What happens?	The administrator creates a spreadsheet containing Employee ID, Name, Email, Department, and Location.	The administrator logs in to ServiceNow and navigates to the Import Sets section.	The administrator uploads the employee spreadsheet into ServiceNow to create an Import Set.	The uploaded employee records are checked for missing fields, incorrect values, and duplicate information.	A Transform Map is created to connect fields in the Import Set Table with corresponding fields in the target Employee Table.	Employee ID, Name, Email, Department, and Location are mapped to their respective target fields.	The system processes the imported data and uses Employee ID as the unique identifier to determine whether a record already exists.	New employee records are inserted, while existing employee records are updated.	The administrator checks the target Employee Table to confirm that the imported information is correct.
Goals & motivations	Help me organize employee details.	Help me access the import process.	Help me import employee information.	Help me identify incorrect information.	Help me connect source and target tables.	Help me map each field correctly.	Help me process employee records.	Help me maintain accurate employee records.	Help me confirm that the import is complete.
Interactions Things / touchpoints	Spreadsheet application; employee data template.	ServiceNow web interface; administrator account.	Spreadsheet file; Import Sets section.	Import Set Table; employee spreadsheet.	Import Set Table; Transform Map configuration.	Source fields and target Employee Table fields.	Transform Map; import processing status.	Employee ID; target Employee Table.	Employee Table; import logs and record summary.
Positive moments	Employee data is arranged in a structured format.	The ServiceNow platform is accessible.	The spreadsheet is uploaded successfully.	Data errors can be detected before transformation.	Fields can be mapped systematically.	Required employee fields are connected to their target fields.	Data is transferred automatically.	New records are inserted and existing records are updated.	Employee information is available for review in the target table.
Negative moments	Missing or incorrectly entered data.	Difficulty finding the Import Sets section.	Unsupported file format or upload errors.	Missing fields and duplicate employee IDs.	Incorrect table or field selection.	Incorrect field mapping may place data in the wrong fields.	Mapping errors or transformation failures.	Incorrect matching may cause unwanted updates.	Some records may fail to import or contain incorrect information.
Areas of opportunity	Use a predefined spreadsheet template with clearly named columns.	Provide clear navigation steps to the Import Sets section.	Display supported file formats and understandable upload error messages.	Add validation and duplicate checking before transformation.	Provide clear field descriptions and mapping guidance.	Review field mappings before running the transform.	Display transformation status and detailed error messages.	Use Employee ID as a unique identifier to match existing records.	Provide import logs and a summary of successful, updated, and failed records.

Expected outcome: Reduce manual data entry, validate employee information, insert new employee records, update existing records using Employee ID, and maintain accurate, organized employee data.
